DSFB Unreal-Native Evidence Bundle

Dataset: ue57_dsfb_temporal_capture_sample

Provenance: unreal_native

Captures: 1

This PDF is generated from one strict Unreal-native replay run. It is an evidence package for technical diligence, not a claim of universal superiority.

The crate is acting as a supervisory trust / admissibility / intervention layer over a real Unreal-exported temporal pipeline input package.

DSFBTemporalCapture / minimal_temporal_pair / frame 1

DSFB Unreal-Native Panel: frame_0001

DSFBTemporalCapture / minimal_temporal_pair / frame 1 / classification = heuristic_favorable

Current frame

Baseline / host output

DSFB trust

DSFB alpha

DSFB intervention

Instability overlay

Key metrics

DSFB ROI MAE: 0.03604

Strong heuristic ROI MAE: 0.00323

Mean trust: 0.5683

Intervention rate: 0.4317

GPU total ms: 0.4814

Interpretation

What went wrong

Temporal reuse risk was concentrated in scene `DSFBTemporalCapture` / shot `minimal_temporal_pair` frame 1 with ROI residual 0.76295 and instability coverage 0.112.

What DSFB detected

DSFB concentrated low trust and intervention in the exported Unreal-native ROI, with ROI MAE 0.03604 against strong heuristic ROI MAE 0.00323.

What DSFB changed

The strongest host heuristic outperformed DSFB on this frame; the evidence is surfaced directly rather than hidden.

Overhead / caveat

GPU measurement is advisory and environment-dependent; baseline source for this frame was `strong_heuristic_baseline`. This is not a renderer replacement claim.

Decision posture

This page summarizes one Unreal-native frame where DSFB is acting as a bounded supervisory layer over a temporal reuse path.

1. What went wrong

Temporal reuse risk was concentrated in scene `DSFBTemporalCapture` / shot `minimal_temporal_pair` frame 1 with ROI residual 0.76295 and instability coverage 0.112.

2. What DSFB detected

DSFB concentrated low trust and intervention in the exported Unreal-native ROI, with ROI MAE 0.03604 against strong heuristic ROI MAE 0.00323.

3. What DSFB changed

The strongest host heuristic outperformed DSFB on this frame; the evidence is surfaced directly rather than hidden.

4. Overhead / caveat

GPU measurement is advisory and environment-dependent; baseline source for this frame was `strong_heuristic_baseline`. This is not a renderer replacement claim.
