DSFB Unreal-Native Evidence Bundle

Dataset: ue57_dsfb_temporal_capture_sequence_sample

Provenance: unreal_native

Captures: 5

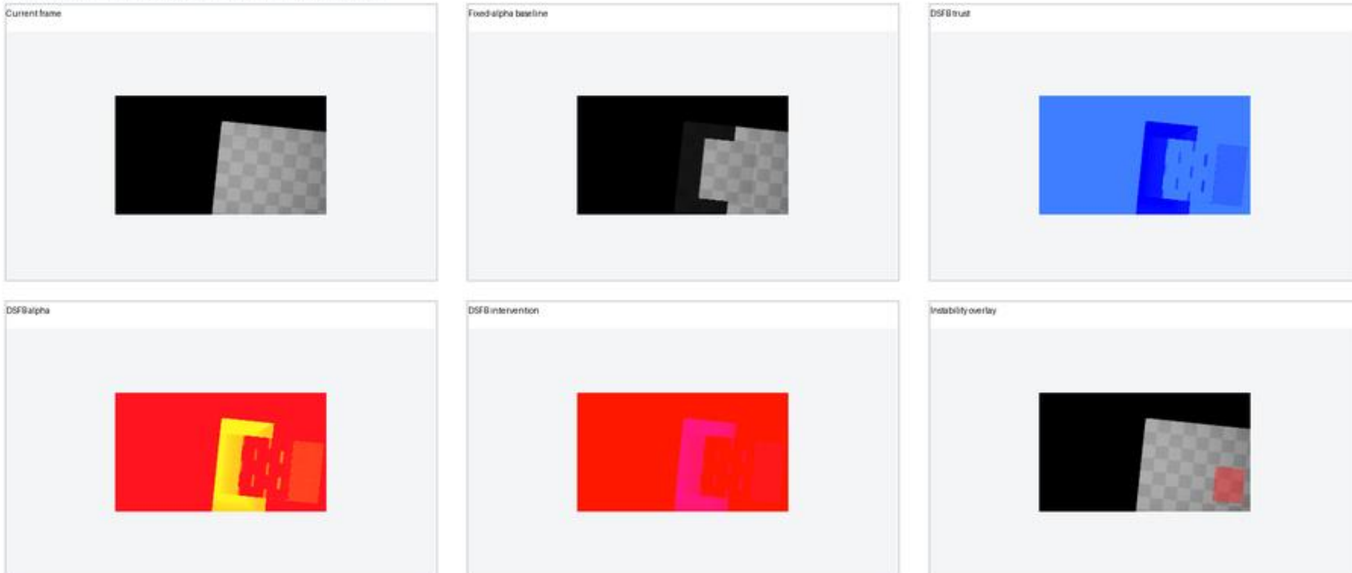
This PDF is generated from one strict Unreal-native replay run. It is an evidence package for technical diligence, not a claim of universal superiority.

The crate is acting as a supervisory trust / admissibility / intervention layer over a real Unreal-exported temporal pipeline input package.

DSFBTemporalCapture / minimal_temporal_sequence / frame 3

DSFB Unreal-Native Panel: frame_0003

DSFBTemporalCapture / minimal_temporal_sequence / frame 3 / classification = heuristic_favorable



Key metrics

DSFB ROI MAE: 0.05388

Strong heuristic ROI MAE: 0.00860

DSFB + heuristic ROI MAE: 0.00615

Mean trust: 0.8678

Intervention rate: 0.1322

GPU total ms: 18.9144

Interpretation

What went wrong

Temporal reuse risk was concentrated in scene `DSFBTemporalCapture` / shot `minimal_temporal_sequence` frame 3 with ROI residual 0.58046 and instability coverage 0.041.

What DSFB detected

DSFB concentrated low trust and intervention in the exported Unreal-native ROI, with ROI MAE 0.05388, strong heuristic ROI MAE 0.00860, and DSFB + heuristic ROI MAE 0.00615.

What DSFB changed

The strongest host heuristic outperformed pure DSFB on this frame, but the explicit DSFB + strong heuristic hybrid recovered that miss and is reported separately rather than relabeled as DSFB.

Overhead / caveat

GPU measurement is advisory and environment-dependent; canonical ROI source is `fixed_alpha_local_contrast_0p15` with 24.97% coverage against reference source `reference_color` and canonical baseline is `fixed_alpha`. No exported host output was available; the canonical benchmark baseline remains fixed alpha. This is not a renderer replacement claim.

Decision posture

This page summarizes one Unreal-native frame where DSFB is acting as a bounded supervisory layer over a temporal reuse path.

1. What went wrong

Temporal reuse risk was concentrated in scene `DSFBTemporalCapture` / shot `minimal_temporal_sequence` frame 3 with ROI residual 0.58046 and instability coverage 0.041.

2. What DSFB detected

DSFB concentrated low trust and intervention in the exported Unreal-native ROI, with ROI MAE 0.05388, strong heuristic ROI MAE 0.00860, and DSFB + heuristic ROI MAE 0.00615.

3. What DSFB changed

The strongest host heuristic outperformed pure DSFB on this frame, but the explicit DSFB + strong heuristic hybrid recovered that miss and is reported separately rather than relabeled as DSFB.

4. Overhead / caveat

GPU measurement is advisory and environment-dependent; canonical ROI source is `fixed_alpha_local_contrast_0p15` with 24.97% coverage against reference source `reference_color` and canonical baseline is `fixed_alpha`. No exported host output was available; the canonical benchmark baseline remains fixed alpha. This is not a renderer replacement claim.

Core metrics

DSFB ROI MAE: 0.05388

Strong heuristic ROI MAE: 0.00860

DSFB + heuristic ROI MAE: 0.00615

Mean trust: 0.8678

Intervention rate: 0.1322

Mean trust: 0.7866

Intervention rate: 0.2135

GPU total ms: 19.4802

Interpretation

What went wrong:

Temporal reuse risk was concentrated in scene `DSFBTemporalCapture` / shot `minimal_temporal_sequence` frame 1 with ROI residual 0.60246 and instability coverage 0.057.

What DSFB detected:

DSFB concentrated low trust and intervention in the exported Unreal-native ROI, with ROI MAE 0.05302, strong heuristic ROI MAE 0.00844, and DSFB + heuristic ROI MAE 0.00635.

What DSFB changed:

The strongest host heuristic outperformed pure DSFB on this frame, but the explicit DSFB + strong heuristic hybrid recovered that miss and is reported separately rather than relabeled as DSFB.

Overhead / caveat:

GPU measurement is advisory and environment-dependent; canonical ROI source is `fixed_alpha_local_contrast_0p15` with 38.41% coverage against reference source `reference_color` and canonical baseline is `fixed_alpha`. No exported host output was available; the canonical benchmark baseline remains fixed alpha. This is not a renderer replacement claim.

Intervention rate: 0.6476

GPU total ms: 19.5371

Interpretation

What went wrong:

Temporal reuse risk was concentrated in scene `DSFBTemporalCapture` / shot `minimal_temporal_sequence` frame 2 with ROI residual 0.89585 and instability coverage 0.101.

What DSFB detected:

DSFB concentrated low trust and intervention in the exported Unreal-native ROI, with ROI MAE 0.03903, strong heuristic ROI MAE 0.00265, and DSFB + heuristic ROI MAE 0.00203.

What DSFB changed:

The strongest host heuristic outperformed pure DSFB on this frame, but the explicit DSFB + strong heuristic hybrid recovered that miss and is reported separately rather than relabeled as DSFB.

Overhead / caveat:

GPU measurement is advisory and environment-dependent; canonical ROI source is `fixed_alpha_local_contrast_0p15` with 74.92% coverage against reference source `reference_color` and canonical baseline is `fixed_alpha`. No exported host output was available; the canonical benchmark baseline remains fixed alpha. This is not a renderer replacement claim.

GPU total ms: 18.3180

Interpretation

What went wrong:

Temporal reuse risk was concentrated in scene `DSFBTemporalCapture` / shot `minimal_temporal_sequence` frame 4 with ROI residual 0.52212 and instability coverage 0.032.

What DSFB detected:

DSFB concentrated low trust and intervention in the exported Unreal-native ROI, with ROI MAE 0.04196, strong heuristic ROI MAE 0.00852, and DSFB + heuristic ROI MAE 0.00662.

What DSFB changed:

The strongest host heuristic outperformed pure DSFB on this frame, but the explicit DSFB + strong heuristic hybrid recovered that miss and is reported separately rather than relabeled as DSFB.

Overhead / caveat:

GPU measurement is advisory and environment-dependent; canonical ROI source is `fixed_alpha_local_contrast_0p15` with 46.31% coverage against reference source `reference_color` and canonical baseline is `fixed_alpha`. No exported host output was available; the canonical benchmark baseline remains fixed alpha. This is not a renderer replacement claim.

Intervention rate: 0.5072

GPU total ms: 18.4018

Interpretation

What went wrong:

Temporal reuse risk was concentrated in scene `DSFBTemporalCapture` / shot `minimal_temporal_sequence` frame 5 with ROI residual 0.79962 and instability coverage 0.071.

What DSFB detected:

DSFB concentrated low trust and intervention in the exported Unreal-native ROI, with ROI MAE 0.03824, strong heuristic ROI MAE 0.00466, and DSFB + heuristic ROI MAE 0.00388.

What DSFB changed:

The strongest host heuristic outperformed pure DSFB on this frame, but the explicit DSFB + strong heuristic hybrid recovered that miss and is reported separately rather than relabeled as DSFB.

Overhead / caveat:

GPU measurement is advisory and environment-dependent; canonical ROI source is `fixed_alpha_local_contrast_0p15` with 68.39% coverage against reference source `reference_color` and canonical baseline is `fixed_alpha`. No exported host output was available; the canonical benchmark baseline remains fixed alpha. This is not a renderer replacement claim.
